

Smart Sensor Wide Laser Beam Measurement Sensor (Line Imaging Device Type) ZX-GT

CSM_ZX-GT_DS_E_1_4

Achieves Micron Accuracy with Longest-in-Class Sensing Distance

- Maximum sensing distance of 500 mm and measuring width of 28 mm provide a wide area.
- 10- μ m accuracy anywhere within the area, even though the sensor uses a non-contact method.
- Stable detection of even transparent glass and mirror surfaces.
- Compact sensor and controller provide minimal installation space requirements.

Refer to *Safety Precautions* on page 8.

For the most recent information on models that have been certified for safety standards, refer to your OMRON website.

Features

Maximum 500-mm area Measurable at any position

Measurements can be consistently taken within a wide area, whatever stage the work is at or whichever way it is inserted. It can now be set to positions without interference from the work feed and without limitations of size of work area.

Accurate! 10- μ m by non-contact method

ZX-GT is the only sensor with the ability to measure and locate position to an accuracy of 10 μ m without contact. Unlike conventional through-beam laser sensors, the ZX-GT's unique algorithm has the flexibility to meet a wide variety of applications, including the ability to accurately measure glass and mirror surfaces.

Small! Compact like palm-top

Compact sensor head that can be set in the gap between equipment.

Its compact controller is a continuation of the ZX series.

New concept "TRIO" 1/7 in speed compared with conventional products

With OMRON'S unique TRIO (Triple parallel processing) algorithm, it is possible to take 2000 high-speed samples per second, 7 times greater than previously possible, greatly reducing tact time.

Leading Technology and Imaging Device Processing Algorithm That Support Stable Measurements

Thoroughly eliminating the effect of the ambient temperature

It is important to eliminate the influence of temperature to ensure the accuracy of a measurement. However, the temperature in the field environment changes according to the time and the season. With the ZX-GT, which employs Imaging Device method, the influence on the resolution from temperature changes is greatly reduced leading to an error rate as low as 0.01% (2.8 micro-meters *).

* This is a representative case. Please see the specifications table for the details of the relevant conditions.

Transparent object detection possible **Integrated MRC filter** **Patented** *1

The detection of edges has been a problem for transparent objects with traditional transmission type sensors. However, ZX-GT adopts OMRON's unique MRC filter * (Mirror Reflection Cut Filter) and Imaging Device methodology. It can accurately detect work that reflects light such as mirror-finished surface or work that allows light to pass through such as glass (including coated glass).

* MRC Filter: OMRON's proprietary optical filter.

Even effective with mirror finished surfaces

Collimate optical technology

Super parallel-beam

With OMRON's unique collimate optical technology *, the closest to ideal parallel beam is created. Errors are controlled in the measurement area and the longest and most accurate measurement is achieved.

* Collimate optical technology
Collimate optical technology allows laser lights to stay parallel using mirror reflection and lens refraction effects, to take advantage of the laser light's high-level of directivity.

Sub-pixel processing

Imaging Device processing algorithm

Imaging Device detects the shadow made from measurement objects and by performing sub-pixel calculation, it achieves 10 micrometer level accuracy.

Easy to use, even from a distance

3-way optical axis adjustment **Patented** ^{*1}

Three optical axis adjustment functions are integrated for the industry's longest measurement. This function provides the optimal adjustment when the sensor head is installed on-site.

With the sensor-head

LED on the light-receiving device is lit up to indicate when the light axis is matched.

With the controller

The Imaging Device light reception balance is displayed in the upper display and the amount of light received can be confirmed with numerical values underneath.

With the PC

The direction of the sensor head's adjustment is graphically displayed. The adjustment conditions can be confirmed through the shapes of the light reception waveforms.

30-m cable extension

The emitter and receiver do not need to be connected with each other. Each cable can be extended up to 30 m. It is perfectly suited for installation into large-scale production line.

F.S.: 28 mm measuring range of receiver

- *1. Distance between emitter and receiver: 500 mm, measurement object at 250 mm from receiver.
Glass ends of chamfer 0.1 mm or more can be detected in glass edge measurement mode. (at binary level 70%)
- *2. Linearity is given to be a typical error with respect to an ideal straight line when the distance between the emitter and receiver is 100 mm and light is blocked at a distance of 50 mm from the receiver.
(On the ZX-GT2840□□, the measurement object is measured at a distance of 20 mm from the receiver.)
- *3. The amount of fluctuation (±3σ) in the analog output when the distance between the emitter and receiver is 100 mm and a ZX-GTC□□ is connected
- *4. Change in the light cutoff value on one side when the distance between the emitter and receiver is 100 mm and the light is half-cutoff at a distance of 50 mm from the receiver
(On the ZX-GT2840□□, the measurement object is measured at a distance of 20 mm from the receiver.)

- *1. A simple average is used in IC lead pitch judgment mode or IC lead width judgment mode.
The measurement cycle time can be calculated as follows: Specified measurement cycle time × (Number of samples to average + 1) + 1 ms max.
In other measurement modes, a moving average is used. The first measurement cycle time can be calculated as follows: Specified measurement cycle time × (Number of samples to average + 1) + 1 ms max. The second and later measurement cycle times will be equal to the specified measurement cycle time.
- *2. The response time in the high-speed mode (FAST) for the IC lead pitch and IC lead width judgment modes is 1 ms.

- *3. Current/voltage can be switched using the switch provided on the rear of the Controller.
*4. Can be set by the analog output scaling function.
*5. The error (ERR) state is displayed when all HIGH/PASS/LOW outputs turn OFF.
*6. Normally, wire the sync output wire directly to the emitter's sync input wire and run the Controller in the standard mode. On an NPN type Controller, use an NPN type emitter, and on a PNP type Controller, use a PNP type emitter. Wiring of the sync wires is not required when the Controller is run in the high-speed mode. (Note, however, that the Controller becomes more susceptible to the influence of ambient light in this case.)
*7. The value is 175 mA max. (including receiver) when current output is set.

Safety Precautions

Refer to the *Technical Guide*.

⚠ WARNING

This product is not designed or rated for ensuring safety of persons either directly or indirectly. Do not use it for such purposes.

CAUTION

**Never look into the laser beam.
Doing so continuously will result in visual
impairment.**

Do not attempt to dismantle, pressurize, or incinerate the product. Doing so may cause the laser beam to leak, resulting in the danger of visual impairment.

For details on information such as the usage precautions → refer to the **ZX-GT Series Smart Sensor User's Manual** (Cat. No.: Z263).
